

Identification of metrics to be measured based on usability attributes.

What will be measured based on each attribute?

To measure the usability attributes of the Medical Service App, we identified specific metrics based on business objectives and user needs (Don José and Dr. Elena).

Metrics to be measured for each attribute:

1. Learnability

The goal is to quantify how quickly a user with no prior experience can master the basic functions.

- **Metric:** Average completion time for the first task.
- **What is being measured:** The time interval from when the user opens the app for the first time until they successfully confirm their first medical appointment without external assistance.
- **Goal:** Less than 3 minutes.

2. Error Handling

This measures the system's ability to guide the user and allow them to recover from failures without abandoning the flow.

- **Metric:** Error recovery success rate.
- **What is being measured:** The percentage of users who, after encountering an error (such as a login failure or connection problems), manage to resolve it by following the human-language on-screen instructions.
- **Goal:** Greater than 90% success rate.

3. Accessibility (Visual and Technological)

Evaluates compliance with standards to ensure the app is usable by people with visual fatigue or technological limitations.

- **Metric:** WCAG 2.1 audit compliance score.
- **What is being measured:** Technical conformity with accessibility guidelines, specifically color contrast (4.5:1), text scaling (up to 200%), and the availability of alternative access methods.
- **Goal:** WCAG 2.1 Level AA.

4. Visibility of System Status (Feedback)

Measures the system's response to avoid "technological anxiety" in the user.

- Metric: Visual response time of the interface.
- What is being measured: The seconds that elapse between a user interaction (e.g., clicking on "Schedule") and the appearance of a loading indicator or confirmation message.
- Goal: Less than 5 seconds.

5. Reduction of Cognitive Load

Determines the mental effort required to process the presented information.

- Metric: Level of perceived mental workload and satisfaction.
- What is being measured: The user's subjective perception after completing a flow, using tools such as the NASA-TLX scale (mental effort) or the SUS (System Usability Scale) for overall satisfaction.
- Goal: More than 80 points on the SUS scale.
