

## FUNCTIONAL REQUIREMENTS

FR01 - Splash Screen: The system must display a start screen featuring institutional colors and the app version for a minimum of 1.5 seconds. This screen serves as a visual loading indicator before automatically redirecting the user to the Login page or Home, depending on the current session status.

FR02 - Office 365 Authentication: The system must allow users to log in using an institutional Office 365 account via a dedicated button.

FR03 - Employment Status Validation: Upon login, the system must verify the employee's current status in the database in real-time. If the user is no longer active, a specific error message must be displayed: "User is not active".

FR04 - Local Data Persistence: To optimize performance and reduce redundant API calls, the system must store the access token, full name, email, and employee ID in local storage.

FR05 - Secure Logout: The application must allow the user to terminate the session, invalidating both Office 365 and local API tokens. To prevent accidental logouts, a confirmation modal must be presented before proceeding.

FR06 - Patient Selection: The system must allow the user to choose between themselves (the employee) or their dependents through a mandatory selector. The interface must dynamically update all displayed information (appointments, records, etc.) based on the selected patient.

FR07 - Appointment Scheduling: Users shall be able to select a medical specialty, shift, date, and doctor.

Error Prevention: The calendar and doctor filters must remain disabled until previous mandatory fields (specialty and shift) are selected to guide the user through a logical flow.

FR08 - Availability Visualization: The system must filter available doctors and schedules based on the employee's assigned campus (e.g., Exact Sciences, Social Sciences) to facilitate physical proximity to the service.

FR09 - Appointment List and Details: The system must display upcoming appointments in ascending chronological order. Selecting an entry must reveal full details, including folio ID, doctor, specialty, shift, and date/time in 24-hour format.

FR10 - Appointment Cancellation: The system must allow users to cancel appointments from either the list or detail view. To ensure user awareness, a confirmation modal must explicitly warn: "This cancellation counts toward your annual limit".

FR11 - Cancellation Limit Control: The system must track cancellations made via the mobile app (MODE 4). Upon reaching the configurable limit (default: 3), the system must automatically block the scheduling flow.

FR12 - Administrative Block Notification: If a user is blocked due to the cancellation policy, the system must display a persistent message indicating that unblocking can only be requested via email.

FR13 - Connection Error Feedback: The system must detect lack of internet or server timeouts (10 seconds) and display clear feedback: "We cannot connect to the internet, please check your connection" or "Connection could not be established, try again later".

FR14 - Persistent Navigation Menu: A fixed bottom navigation bar must be included, providing quick access to Home, Passes, Records, and Appointments. The active page must be visually distinguished to provide clear orientation.

FR15 - Dependent Search Tool: Within the dependents module, the system must provide a real-time filter that activates after 3 characters are typed. The search must be case-insensitive and ignore accents/tildes to minimize user typing effort.

FR16 - Configuration Screen: This screen must display the logged-in user's email and provide links to external resources (Privacy Policy, Operations Manual, About Us) that open in the device's external browser.

## NON-FUNCTIONAL REQUIREMENTS

NFR-U-01 – Legibility: The interface must support OS font scaling, maintaining a base size of 16px to ensure readability for the 45-70 age group.

NFR-U-02 - Contrast: The design must comply with AA (WCAG 2.1) standards with a minimum 4.5:1 contrast ratio to reduce visual fatigue.

NFR-U-03 - Interactivity: Buttons and clickable elements must have a minimum target area of 44x44 dp to facilitate interaction for users with less digital experience.

NFR-U-04 - Cognitive Load: The scheduling flow must use progressive disclosure, showing a maximum of 3 fields per screen to avoid overwhelming the user.

NFR-U-05 - Clear Navigation: Bottom menu icons (FR14) must include mandatory text labels to ensure the interface does not require advanced organizational skills.

NFR-U-06 - Human Language: Errors must be described in natural, non-technical language, always explaining the next step to resolve the issue.

NFR-U-07 - Visual Feedback: For any action lasting longer than 200ms, the system must show a loading indicator to mitigate anxiety when using digital interfaces.
