Hello everyone! Today, I'm excited to share our project "**UADY Medical Service App**". We are tackling a very real and human-centered challenge: simplifying access to healthcare for the people who keep our university running.

We identified a critical issue at UADY. Currently, beneficiaries of the university medical service—like maintenance workers, faculty, and admin staff—have to manage appointments, passes, and records either in person at a window or by phone. This process is slow and, more importantly, it risks excluding a significant part of our community.

So, what are we building? We are designing a mobile application that digitizes these medical procedures. It will allow users to schedule appointments, manage medical passes for their dependents, and access their records, all from their phone.

Why is this a design challenge? Because our users are not all the same. We have two primary profiles with contrasting needs.

First, there's **Don José**. He's a 52-year-old maintenance worker. He's been at UADY for over 20 years, but he has low digital literacy. He doesn't use his institutional email and struggles with complex passwords. For him, a system that relies only on Office 365 is an automatic barrier.

Second, there's **Dra. Elena**. She's a 62-year-old senior professor. She uses a computer daily but suffers from visual fatigue. She needs large fonts, high contrast, and clear, simple navigation to feel confident using an app.

But the key is *how* we're building it. Our approach is rooted in User-Centered Design. We're not just adding digital features; we're rethinking the experience from the ground up for our most vulnerable users.

"So, where are we now? We have successfully completed the foundational phase of our project.

We have:

- Defined our core problem and objective.
- Created two detailed personas based on stakeholder analysis.
- Defined a complete set of functional and non-functional requirements, resolving the key conflict of authentication.

Our next steps are to move into the design phase. We will create low-fidelity prototypes and then move to high-fidelity interactive mockups. These will be rigorously tested with users representing Don José and Dra. Elena to validate our design decisions."

"In conclusion, we're not just building another app. We're designing a digital bridge to ensure that every member of the UADY community, regardless of their digital skills, has equal and

dignified access to their medical services. We believe that technology should adapt to people, not the other way around.
